

Arrays and Classes

Produced
by:

Dr. Siobhán Drohan,
Ms. Mairead Meagher,
Ms. Siobhán Roche.

Topics list

1. Arrays of different types

2. Arrays of primitive types

3. Arrays of objects

- String

- Person

Let's Look at arrays of different types

Arrays can store any type of data

Let's look at some examples:

1. Array of primitives - **int**
2. Array of objects – **String**
3. Array of objects - **Product**

An array can store any type of data.

Primitive Types

```
int numbers[] = new int[10];
```

```
byte smallNumbers[] = new byte[4];
```

```
char characters[] = new char[26];
```

Object Types

```
String[] words = new String[4];
```

```
Person[] friends = new Person[4];
```

Topics list

1. Arrays of different types

2. Arrays of primitive types

3. Arrays of objects

- String

- Person

Structure of an **int** primitive array

int[] numbers;

numbers

null

Structure of an **int** primitive array

```
int[] numbers;
```

```
numbers = new int[4];
```

numbers

0	0
1	0
2	0
3	0

Structure of an **int** primitive array

```
int[] numbers;
```

```
numbers = new int[4];
```

```
numbers[2] = 18;
```

We are directly
accessing the
element at index **2**
and setting it to a
value of **18**.

numbers

0	0
1	0
2	18
3	0

Structure of an **int** primitive array

```
int[] numbers;
```

```
numbers = new int[4];
```

```
numbers[2] = 18;
```

```
numbers[0] = 12;
```

We are setting the
element at index **0**
to a value of **12**.

numbers

0	12
1	0
2	18
3	0

Structure of an **int** primitive array

```
int[] numbers;
```

```
numbers = new int[4];
```

```
numbers[2] = 18;
```

```
numbers[0] = 12;
```

```
print(numbers[2]);
```

numbers

0	12
1	0
2	18
3	0

Here we are printing the contents of
index location 2
i.e. 18 will be printed to the console.

Topics list

1. Arrays of different types
2. Arrays of primitive types

3. Arrays of objects

- String 
- Person

An array can store any type of data.

Primitive Types

```
int numbers[] = new int[10];
```

```
byte smallNumbers[] = new byte[4];
```

```
char characters[] = new char[26];
```

Object Types

```
String[] words = new String[4];
```

```
Person[] friends = new Person[4];
```

Structure of a **String** object array

String[] words;

words

null

Structure of a **String** object array

```
String[] words;
```

```
words = new String[4];
```

words

0	null
1	null
2	null
3	null

Structure of a **String** object array

```
String[] words;
```

```
words = new String[4];
```

```
words[1] = "Dog";
```

words

0	null
1	
2	null
3	null

"Dog"

Structure of a **String** object array

```
String[] words;
```

```
words = new String[4];
```

```
words[1] = "Dog";
```

We are directly accessing the element at index **1** and setting it to a value of **"Dog"**.

words

0	null
1	
2	null
3	null

"Dog"

Structure of a **String** object array

```
String[] words;
```

```
words = new String[4];
```

```
words[1] = "Dog";
```

```
words[3] = "Cat";
```

words

0	null
1	
2	null
3	

"Dog"

"Cat"

Structure of a **String** object array

```
String[] words;
```

```
words = new String[4];
```

```
words[1] = "Dog";
```

```
words[3] = "Cat";
```

The element at index
3 is set to **"Cat"**.

words

Structure of a **String** object array

```
String words[];  
  
words = new String[4];  
  
words[1] = "Dog";  
words[3] = "Cat";  
  
for (int i=0; i < words.length; i++)  
{  
    System.out.println(words[i]);  
}
```

```
null  
Dog  
null  
Cat
```

Topics list

1. Arrays of different types
2. Arrays of primitive types

3. Arrays of objects

- String

- Person 

An array can store any type of data.

Primitive Types

```
int numbers[] = new int[10];
```

```
byte smallNumbers[] = new byte[4];
```

```
char characters[] = new char[26];
```

Object Types

```
String[] words = new String[4];
```

```
Person[] friends = new Person[4];
```

Person Class

**Object Type/
Class Name**

Fields

i.e. the attributes of
the class

Methods

i.e. the behaviours of
the class

Person Class Diagram

```
classDiagram
    class Person {
        +int age
        +String firstName
        +String secondName
        +float temperature
        +Person(String firstName, String secondName, int age)
        +int getAge()
        +String getFirstName()
        +String getSecondName()
        +float getTemperature()
        +void setAge(int age)
        +void setFirstName(String firstName)
        +void setSecondName(String secondName)
        +void setTemperature(float temperature)
        +void printAge()
        +void printFirstName()
        +void printFullName()
        +void printTemperature()
        +int happyBirthday()
    }
```

C Person

□ int age
□ String firstName
□ String secondName
□ float temperature

● Person(String firstName, String secondName, int age)
● int getAge()
● String getFirstName()
● String getSecondName()
● float getTemperature()
● void setAge(int age)
● void setFirstName(String firstName)
● void setSecondName(String secondName)
● void setTemperature(float temperature)
● void printAge()
● void printFirstName()
● void printFullName()
● void printTemperature()
● int happyBirthday()

Structure of a primitive array of **Person**

Person[] friends;

friends

null

Structure of a **Product** primitive array

Person[] friends;

friends = new Person[4];

friends

0	null
1	null
2	null
3	null

Structure of a **Product** primitive array

```
Person[] friends;
```

```
friends = new Person[4];
```

products

0	null
1	
2	null
3	null

private int age	25
private String firstName	"Joey"
private String secondName	"Tribbiani"
private float temperature	13.2

```
friends[1] = new Person("Joey", "Tribbiani", 25,);
```

Example using a **Person** object array

```
public String listFriends() {  
  
    String listOfFriends = "";  
  
    for (int i = 0; i < friends.length; i++) {  
        friends[i]. printFirstName();  
        friends[i]. printSecondName();  
    }  
  
    return listOfProducts;  
}  
}
```

Returns the first and second names of all friends stored in the primitive array.
